the idea of writing this book came roughly at the time of publication of my graduate text lectures on modules and rings springer gtm vol 189 1999 since that time teaching obligations and intermittent intervention of other projects caused prolonged delays in the work on this volume only a lucky break in my schedule in 2006 enabled me to put the finishing touches on the completion of this long overdue book this book is intended to serve a dual purpose first it is designed as a problem book for lectures as such it contains the statements and full solutions of the many exercises that appeared in lectures second this book is also offered as a reference and repository for general information in the theory of modules and rings that may be hard to find in the standard textbooks in the field as a companion volume to lectures this work covers the same mathematical material as its parent work namely the part of ring theory that makes substantial use of the notion of modules the two books thus share the same table of contents with the first half treating projective injective and flat modules homological and uniform dimensions and the second half dealing with noncommutative localizations and goldie's theorems maximal rings of quotients frobenius and quasi frobenius rings concluding with morita's theory of category equivalences and dualities
